General Rule of Thumb
1 As distances to outfield walls increases a hitter will hit fewer home runs.
2 As height of the outfield wall increases a hitter will hit fewer home runs.
3 Left-handed hitters will most be affected by distances to RF and RCF with a moderate effect by the distance to CF and a small effect by the distance to LF and LCF
4 Right-handed hitters will most be affected by distances to LF and LCF with a moderate effect by the distance to CF and a small effect by the distance to RF and RCF.
5 Switch-hitters will be most affected by distances to LF, LCF, RCF, RF and moderately affected by distances to CF.
6 all hitters will be affected by the height of the outfield walls
7 The distance to the outfield wall may increase or decrease a hitter's chances of hitting a home run but increases to the outfield wall height above the minimum will only decrease the chances of a hitter hitting a home run.

| NOTE |  |  |  |  |  |
| - the maximum increase to home run occurrence is 30\% |  |  |  |  |  |
| - the maximum reduction to home runs is $30 \%$ |  |  |  |  |  |
| - the maximum impact of wall distances is plus $25 \%$ or minus $25 \%$ |  |  |  |  |  |
| - the maximum impact on wall heights is minus $25 \%$ |  |  |  |  |  |
| ... if you build a hamster cage with really high walls you can effectively cancel the impact of having a short distance to the walls |  |  |  |  |  |

For every $+/-1$ there is a $5 \%$ increase (PLUS) or decrease (MINUS) to the likelihood of a home run being hit. A rating of EVEN means there is no adjustment to the home run numbers hit for hitters and allowed for pitchers.

For example, a hitter playing all 162 games in a park rated +5 to all fields would be $25 \%$ (plus $5 \times 5 \%$ ) more likely to hit home runs than he would in a ballpark rated EVEN. Similarly, a pitcher in one of these ballparks would be expected to give up $25 \%$ more home runs than a pitcher in a home run neutral (EVEN) ballpark.
